

Entering the Future of Energy  
16 March 2017

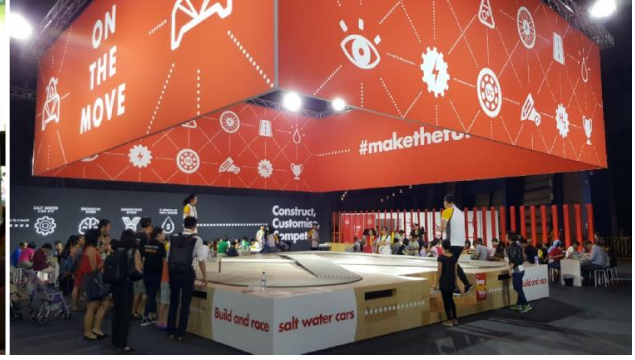

Who needs a charging dock if a phone can be powered by walking? Electricity is now sustainable, using renewable energy rather than fuel. These ideas presented by secondary school students blew the minds of our children at Shell's *The Bright Idea Challenge*.

"I didn't know these technologies existed! A shoe can also be used as a charger. The electronics we use every day can be made eco-friendly," reflected Mr Marcus Ng, 11 years old.

It was indeed an enriching learning experience for our students and teachers from Lakeside Student Care as they explored the *Make the Future Festival* filled with interactive games and exhibits. "My favourite is the Zorb ball competition! And we built our future house, where everything is recyclable!" shared Ms Tiffany Leong, 10 years old.

Raam, a familiar volunteer from Shell Nexus was impressed with his group's future house, "The children were very innovative in their ideas and maximising of resources. All they needed was an opportunity to share their ideas."

Thank you Shell Nexus for encouraging our children to let their creative juices flow!
